

Description

The F1129LB is a single-ended input / differential output 1.4GHz to 3.2GHz high gain RF amplifier. The combination of impedance translation, high gain, high linearity, and low noise performance makes this device an ideal amplifier for a variety of receiver applications.

The F1129LB has been optimized to operate with a single 5V power supply and a nominal 61mA of I_{CC} . When operated at 2.5GHz, the device provides 20dB typical gain with 1.6dB noise figure and +36dBm OIP3.

The F1129LB is pin-compatible with Renesas' F1129xx family of RF amplifiers, offering additional frequency and output impedance options. Each F1129 variant is packaged in a 2×2 mm, 12-VFQFPN, with a 50Ω single-ended RF input and 100Ω differential RF output impedances for ease of integration in the signal path.

F1129xx Base Part Number	Differential Output Impedance	Frequency Band	Frequency Coverage
F1129LB	100Ω	Low	1.4GHz to 3.2GHz
F1129MB	100Ω	Mid	3.0GHz to 4.2GHz
F1129HB	100Ω	High	4.0GHz to 6.0GHz

Competitive Advantage

- High gain
- Excellent gain flatness over frequency
- Near-constant gain versus temperature

Typical Applications

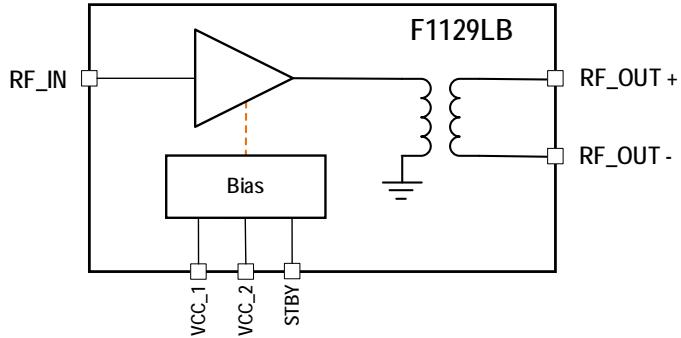

- 5G / Massive MIMO base stations
- 4G TDD and FDD base stations
- 2G/3G base stations
- Repeaters and DAS
- Point-to-point infrastructure
- Public-safety infrastructure
- Military handhelds

Features

- RF range: 1.4GHz to 3.2GHz
- Gain = 20dB typical at 2.5GHz
- Noise figure = 1.6dB typical at 2.5GHz
- OIP3 = +36dBm typical at 2.5GHz
- Output P1dB = +20.5dBm typical at 2.5GHz
- Gain variation over temperature = ± 0.2 dB typical
- 50Ω single-ended input impedance
- 100Ω differential output impedance
- 3.3V or 5V power supply
- I_{CC} = 61mA at 5V
- 1.4mA standby current
- 1.8V and 3.3V logic support for STBY control
- Operating temperature (T_{EP}) range: -40°C to +115°C
- 2×2 mm 12-VFQFPN package

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1, 3, 4, 5, 7, 10	NC	No internal connection. It is highly recommended that these pins be connected to a ground via that is located as close to each pin as possible.
2	RF_IN	Single-ended RF input. An external DC block is required.
6	STBY	Standby. If this pin is not connected or is logic LOW, the F1129LB will operate under its normal operating condition. Apply a logic HIGH for STBY.
8	RF_OUT+	Differential RF output +. Internally tied to ground. Recommendation: Use an external DC block to prevent shorting of any DC voltage that may be present on the following RF stage.
9	RF_OUT-	Differential RF output -. Internally tied to ground. Recommendation: Use an external DC block to prevent shorting of any DC voltage that may be present on the following RF stage.
11	VCC_1	Connect to the supply voltage via a choke. An external bypass capacitor must be placed as close to the pin as possible.
12	VCC_2	Connect to V_{CC} . An external bypass capacitor must be placed as close to the pin as possible.
	EPAD	Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board (PCB) pad that uses multiple ground vias to provide heat transfer out of the F1129LB into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the F1129LB at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions might affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Unit
VCC_1, VCC_2 to GND	V _{CC}	-0.3	+5.5	V
STBY	V _{STBY}	-0.3	Lower of (5V, V _{CC} + 0.25V)	V
RF Input Power applied for 24 Hours maximum (V _{CC} applied, f = 2.5GHz, T _{EP} = +115°C, and input/output VSWR = 1:1 based on a 100Ω system.) [a, b]	P _{MAX24}	-	+22	dBm
Storage Temperature Range	T _{STOR}	-65	+150	°C
Lead Temperature (soldering, 10s)	T _{LEAD}	-	+260	°C
Electrostatic Discharge – Human Body Model (HBM) (JEDEC/ESDA JS-001-2012)	V _{ESDHBM}	-	500	V
Electrostatic Discharge – Charge Device Model (CDM) (JEDEC 22-C101F)	V _{ESDCDM}	-	1500	V

[a] Exposure to these maximum RF levels can result in significant V_{CC} current draw due to overdriving the amplifier stages.

[b] Tested using an external 2:1 transformer at the RF output.

Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Unit
Power Supply Voltage [a]	V _{CC}	V _{CC} pins	4.75	-	5.25	V
Operating Temperature Range	T _{EP}	Exposed paddle temperature	-40	-	+115	°C
Junction Temperature	T _{JMAX}		-	-	150	°C
RF Frequency Range [b]	f _{RF}		1.4	-	3.2	GHz
RF_IN Source Impedance	Z _{RF_IN}	Single-ended	-	50	-	Ω
RF_OUT Load Impedance	Z _{RF_OUT}	Differential	-	100	-	Ω

[a] Although the device will operate with a minimum supply voltage of 3.15V, the performance of the device has been optimized to operate within a supply voltage range of 4.75V to 5.25V.

[b] To optimize RF performance, different matching components can be used as described in the BOM.

Electrical Characteristics – 5V Supply

See the F1129LB application circuit. Specifications apply when operated at $V_{CC} = +5.0V$, $f_{RF} = 2.5GHz$, $T_{EP} = +25^\circ C$, STBY = logic LOW, $Z_S = 50\Omega$ single-ended, $Z_L = 100\Omega$ differential, and EVKit traces and connectors are de-embedded, unless otherwise stated.

- [f] OIP3 test conditions: Tone spacing = 5MHz, POUT = +0dBm/tone.
- [g] Harmonic Distortion test conditions: P_{OUT} = +0dBm/tone.

Thermal Characteristics

Table 6. Package Thermal Characteristics

Parameter	Symbol	Value	Unit
Junction-to-Ambient Thermal Resistance.	θ_{JA}	112.57	°C/W
Junction-to-Case Thermal Resistance. (Case is defined as the exposed paddle.)	θ_{JC-BOT}	27.6	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 1	

Typical Operating Conditions (TOC)

Unless otherwise noted, for the TOC graphs on the following pages, the following conditions apply:

- Evaluation kit connector and trace losses are de-embedded
- $V_{CC} = 3.3V, 5.0V$
- STBY = not connected (internally pulled to logic LOW)
- $T_{EP} = 25^\circ C$
- Small signal parameters measured with $P_{OUT} = 0\text{dBm}$
- Two tone tests $P_{OUT} = 0\text{dBm}/\text{tone}$ with 5MHz tone spacing
- All unused ports properly terminated.
- S-parameters (S11, S21, S12, and S22) measured using a de-embedded Differential Board (EVKit) with $Z_S = \text{single-ended } 50\Omega$ and $Z_L = \text{differential } 100\Omega$. The inputs are mathematically combined using an ideal 1:2 ($50\Omega:100\Omega$) transformer to produce the 2-port S-parameters.
- OIP3, Output P1dB and Noise Figure measured using a Transformer Board EVKit with $Z_S = Z_L = \text{single-ended } 50\Omega$.
- Amplitude and phase imbalances measures RF_IN to RF_OUT+ and compares to RF_IN to RF_OUT-.
- The phase imbalance is the deviation from an ideal 180 degrees.

Note: The use of the external transformer T1 is included for simple 2-port evaluation purposes. At some frequencies, the external transformer interacts with the on-chip balun affecting the gain and noise figure flatness responses. These interactions have been removed from the noise figure TOCs.

Application Information

Power Supplies

A common VCC power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V/20\mu S$. In addition, all control pins should remain at 0V ($\pm 0.3V$) while the supply voltage ramps or while it returns to zero.

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of the STBY control pin is recommended. This applies to the STBY pin as shown below. Note the recommended resistor and capacitor values do not necessarily match the EV Kit BOM for the case of poor control signal integrity. For multiple devices driven by a single control line, the component values will need to be adjusted accordingly so as not to load down the control line.

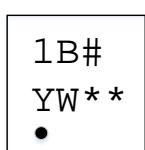

Figure 26. Control Pin Interface Schematic

Package Outline Drawings

The package outline drawings are located at the end of this document and are accessible from the Renesas website. The package information is the most current data available and is subject to change without revision of this document.

Marking Diagram

- Line 1:
 - 1B = two-digit part identifier
 - # = stepping indicator
- Line 2:
 - Y = year code, last digit of production year ("8" would correspond to 2018)
 - W = work week code ("Y" corresponds to week 30)
 - ** = sequential alpha characters for lot traceability

Ordering Information

Orderable Part Number	Package	MSL Rating	Carrier Type	Temperature
F1129LBNELI	2 × 2 × 0.75 mm 12-VQFPN	1	Cut Reel	-40° to +115°C
F1129LBNELI8	2 × 2 × 0.75 mm 12- VQFPN	1	Reel	-40° to +115°C
F1129LBEVB	Evaluation Board			

Revision History

Revision Date	Description of Change
October 4, 2022	Updated Marking Diagram information.
January 31, 2021	<ul style="list-style-type: none">▪ Updated the Package Outline Drawings website link.▪ Updated the Carrier Type information in Ordering Information.
May 21, 2020	Updated base part number table in Description.
April 29, 2020	Added Application Information section.
January 17, 2020	Updated Evaluation Kit pictures.
November 24, 2019	Updated the electrostatic discharge ratings in Table 2.
November 10, 2019	Initial release.
